SUMMARY

Secret-cleared software developer with three years on large-scale online public-service applications delivered for overseas government programs. Backend focus in Java and Spring Boot with Java Vaadin and Angular front ends, covering payment gateway and third-party API integration, application workflow design, performance tuning, and security remediation. Bachelor of Engineering in Software, Carleton University; first author of a peer-reviewed open-source Python package.

TECHNICAL SKILLS

LANGUAGES	Java, Python, TypeScript, JavaScript, SQL
FRAMEWORKS	Spring Boot, Java Vaadin, Angular, React, Python Flask, JUnit, Thymeleaf
DATA	PostgreSQL, Oracle, Pandas, NumPy
PLATFORM	Docker, Bamboo, Azure DevOps, Git, Maven, Linux, Windows, QNX
FOCUS	Payment gateway integration, third-party APIs, application workflow design, performance tuning, security remediation, production support
PRACTICE	Scaled agile, code review, release testing, CI/CD, mentoring and onboarding
ALSO	C/C++, Go, MySQL, SQLite — coursework and personal projects

EXPERIENCE

Canadian Bank Note Company — ID Systems

September 2023 – Present

Software Developer

Ottawa, ON

Overseas government IT programs, delivered under client confidentiality. Five-developer team.

- **Three years' continuous ownership of two large-scale online public-service applications** on an overseas program, built on a Java Spring backend with a Java Vaadin front end.
- Own features end to end — design, implementation, testing, release, and ongoing support — and make the architecture and design decisions behind them rather than building to someone else's spec.
- **Integrated payment gateways and third-party APIs**, and designed the multi-step online application processing workflows behind them.
- Delivered features across six overseas programs over the first two years, before the portfolio was divided and those deployments moved to a dedicated international team.
- Onboarded an incoming developer onto the programs transferring to that team, and act as the reference developer on the programs I retained.
- Took on two further programs in the past year, building backend services in Java and Spring Boot with supporting Angular front-end work.
- Own production defect resolution, carrying each issue from support intake through root cause to a shipped fix, including out-of-hours escalation when an issue is serious.
- Improve response times with caching and reworked backend data access paths, and hold large Vaadin data tables and combo boxes responsive under load with custom JavaScript.
- Remediate findings raised by third-party security assessments.

- Containerize services with Docker under Ubuntu Linux and Windows WSL; work against PostgreSQL and Oracle; ship through Bamboo and Azure DevOps pipelines.
- Build Python tooling for large-scale test data generation and trend analysis.

NAV Canada — Surveillance Engineering

April 2022 – September 2022

Software Developer, Co-op

Ottawa, ON

NAV Canada runs the country's civil air navigation system. This team built the software that manages and distributes air traffic surveillance data.

- Built and maintained configurable site-specific installation packages for a React JS project using INNO Setup.
- Wrote test procedures and cases across a range of surveillance applications running on QNX real-time systems, then executed them against quality control standards and logged the results.
- Reviewed teammates' code changes before merge, and extended the documentation to cover new terminology.

National Defence — Canadian Joint Operations Command

February 2021 – January 2022

Developer / Analyst, Co-op

Ottawa, ON

CJOC plans and runs Canadian Forces operations. The GeoHexVis project produced reusable geospatial maps in support of operational analysis.

- Built GeoHexViz, a Pandas and NumPy based Python package for publication-quality visualization of hexagonally binned geospatial data, used for operational analysis, and published it as first author in the Journal of Open Source Software.
- Analyzed data for aeronautical Search and Rescue studies and identified performance trends that fed into operational recommendations.
- Presented the package at two seminars, replaced a manual map generation process with repeatable scripts, and co-authored a government reference document.

SELECTED PROJECTS

EVASE Capstone, Team Lead · Python Flask, React · 2022–2023

Web application that scans Python source for SQL injection vulnerabilities using abstract syntax trees. Wrote components of the detection algorithm, the Flask backend, the React front end, and the scheme for storing and purging client code on the server. Detection engine published separately as EvaseAnalysis.

EDUCATION

Carleton University 2019 – 2023

Bachelor of Engineering, Software (SYSC)

Entrance Scholarship · CGPA 11.05 / 12 (A)

Angular — The Complete Guide (Udemy, 56 h), 2025
